# Preface

Document conventions	5
Brocade resources	7
Contacting Brocade Technical Support	7
Document feedback	8

# **Document conventions**

The document conventions describe text formatting conventions, command syntax conventions, and important notice formats used in Brocade technical documentation.

# **Text formatting conventions**

Text formatting conventions such as boldface, italic, or Courier font may be used in the flow of the text to highlight specific words or phrases.

Format	Description
bold text	Identifies command names
	Identifies keywords and operands
	Identifies the names of user-manipulated GUI elements
	Identifies text to enter at the GUI
<i>italic</i> text	Identifies emphasis Identifies variables Identifies document titles
Courier font	Identifies CLI output Identifies command syntax examples

## **Command syntax conventions**

Bold and italic text identify command syntax components. Delimiters and operators define groupings of parameters and their logical relationships.

Convention	Description
bold text	Identifies command names, keywords, and command options.
italic text	Identifies a variable.
value	In Fibre Channel products, a fixed value provided as input to a command option is printed in plain text, for example, <b>show</b> WWN.

Convention	Description
[]	Syntax components displayed within square brackets are optional.
	Default responses to system prompts are enclosed in square brackets.
{ <b>x</b>   <b>y</b>   <b>z</b> }	A choice of required parameters is enclosed in curly brackets separated by vertical bars. You must select one of the options.
	In Fibre Channel products, square brackets may be used instead for this purpose.
х   у	A vertical bar separates mutually exclusive elements.
<>	Nonprinting characters, for example, passwords, are enclosed in angle brackets.
	Repeat the previous element, for example, member[member].
١	Indicates a "soft" line break in command examples. If a backslash separates two lines of a command input, enter the entire command at the prompt without the backslash.

### Notes, cautions, and warnings

Notes, cautions, and warning statements may be used in this document. They are listed in the order of increasing severity of potential hazards.

### NOTE

A Note provides a tip, guidance, or advice, emphasizes important information, or provides a reference to related information.

### ATTENTION

An Attention statement indicates a stronger note, for example, to alert you when traffic might be interrupted or the device might reboot.

### CAUTION

A Caution statement alerts you to situations that can be potentially hazardous to you or cause damage to hardware, firmware, software, or data.

### DANGER

A Danger statement indicates conditions or situations that can be potentially lethal or extremely hazardous to you. Safety labels are also attached directly to products to warn of these conditions or situations.

# **Brocade resources**

Visit the Brocade website to locate related documentation for your product and additional Brocade resources.

You can download additional publications supporting your product at www.brocade.com. Select the Brocade Products tab to locate your product, then click the Brocade product name or image to open the individual product page. The user manuals are available in the resources module at the bottom of the page under the Documentation category.

To get up-to-the-minute information on Brocade products and resources, go to MyBrocade. You can register at no cost to obtain a user ID and password.

Release notes are available on MyBrocade under Product Downloads.

White papers, online demonstrations, and data sheets are available through the Brocade website.

# **Contacting Brocade Technical Support**

As a Brocade customer, you can contact Brocade Technical Support 24x7 online, by telephone, or by email. Brocade OEM customers contact their OEM/Solutions provider.

### **Brocade customers**

For product support information and the latest information on contacting the Technical Assistance Center, go to http://www.brocade.com/services-support/index.html.

If you have purchased Brocade product support directly from Brocade, use one of the following methods to contact the Brocade Technical Assistance Center 24x7.

Online	Telephone	E-mail
Preferred method of contact for non- urgent issues:	Required for Sev 1-Critical and Sev 2-High issues:	support@brocade.com Please include:
<ul> <li>My Cases through MyBrocade</li> <li>Software downloads and licensing tools</li> <li>Knowledge Base</li> </ul>	<ul> <li>Continental US: 1-800-752-8061</li> <li>Europe, Middle East, Africa, and Asia Pacific: +800-AT FIBREE (+800 28 34 27 33)</li> <li>For areas unable to access toll free number: +1-408-333-6061</li> <li>Toll-free numbers are available in many countries.</li> </ul>	<ul> <li>Problem summary</li> <li>Serial number</li> <li>Installation details</li> <li>Environment description</li> </ul>

# **Brocade OEM customers**

If you have purchased Brocade product support from a Brocade OEM/Solution Provider, contact your OEM/Solution Provider for all of your product support needs.

- OEM/Solution Providers are trained and certified by Brocade to support Brocade<sup>®</sup> products.
- Brocade provides backline support for issues that cannot be resolved by the OEM/Solution Provider.

- Brocade Supplemental Support augments your existing OEM support contract, providing direct access to Brocade expertise. For more information, contact Brocade or your OEM.
- For questions regarding service levels and response times, contact your OEM/Solution Provider.

# **Document feedback**

To send feedback and report errors in the documentation you can use the feedback form posted with the document or you can e-mail the documentation team.

Quality is our first concern at Brocade and we have made every effort to ensure the accuracy and completeness of this document. However, if you find an error or an omission, or you think that a topic needs further development, we want to hear from you. You can provide feedback in two ways:

- Through the online feedback form in the HTML documents posted on www.brocade.com.
- By sending your feedback to documentation@brocade.com.

Provide the publication title, part number, and as much detail as possible, including the topic heading and page number if applicable, as well as your suggestions for improvement.

# What's new in this document

LAG scaling

VRF ID

This document is updated for FastIron software releases 08.0.30 through 08.0.30x. The following tables include information on new upgrade considerations introduced with the release. For a full description of new features, refer to the FastIron 08.0.30 release notes.

TABLE 1 Summary of Enhancements in FastIron Release 08.0.30d

Feature	Description	Location
mac-authentication enable- dynamic-vlan not supported	The <b>mac-authentication enable-</b> <b>dynamic-vlan</b> command introduced in FastIron 08.0.30b is deprecated.	References to the command in text and CLI samples have been removed throughout the section on flexible authentication.

Feature	Description	Location
Flexible authentication enhancements	Several CLI changes were introduced for flexible authentication.	Upgrading to or downgrading from FastIron 08.0.30 on page 13
Symmetric load balancing CLI	New CLI has been added for symmetric load balancing.	Upgrading to or downgrading from FastIron 08.0.30 on page 13

Maximum LAGs per ICX 7250, ICX 7450, or ICX 7750 device increases

A new VRF ID field is introduced in

the dhcpsnoop.txt flash file.

### TABLE 2 Summary of Enhancements in FastIron Release 08.0.30b

### **TABLE 3** Summary of Enhancements in FastIron Release 08.0.30

to 256.

Feature	Description	Location
BGP4+ Multi-VRF	Added in this release.	Upgrading to or downgrading from FastIron 08.0.30 on page 13
Equal Cost Multi-Path	Equal Cost Multi-Path (ECMP) increases the maximum number of paths to 32 on ICX 7750 devices.	Upgrading to or downgrading from FastIron 08.0.30 on page 13

Upgrading to or downgrading from

Upgrading to or downgrading from

FastIron 08.0.30 on page 13

FastIron 08.0.30 on page 13

Feature	Description	Location
Flash timeout configuration	This release allows the user to change flash timeout.	Upgrading to or downgrading from FastIron 08.0.30 on page 13
ICX 6610 license merge	Premium and advanced licensing features are merged under the premium license.	Upgrading to or downgrading from FastIron 08.0.30 on page 13. For more information on licenses, refer to the FastIron Ethernet Switch Licensing Guide, Release 08.0.30.
ICX 7450 10 Gbps stacking	10 Gbps stacking is available on 4x10G modules inserted in slot 2.	Upgrading to or downgrading from FastIron 08.0.30 on page 13
ICX 7750 breakout ports	This release introduces physical breakout of 40-Gbps ports on the ICX 7750 into four configurable 10- Gbps sub-ports.	Upgrading to or downgrading from FastIron 08.0.30 on page 13
ICX 7750 cut-through mode	This release introduces cut-through mode on the ICX 7750.	Upgrading to or downgrading from FastIron 08.0.30 on page 13
LAG enhancements	This release introduces several LAG enhancements, including the ability to rename the LAG dynamically, increased port capacity, and the addition of the <b>show interface lag</b> command.	Upgrading to or downgrading from FastIron 08.0.30 on page 13
Layer 3 multicast routing over MCT	This feature is introduced on the ICX 7750.	Upgrading to or downgrading from FastIron 08.0.30 on page 13
Layer 3 unicast routing over MCT	This feature is introduced on the ICX 7750.	
sflow CLI changes	Several <b>sflow source</b> commands are introduced.	Upgrading to or downgrading from FastIron 08.0.30 on page 13
Stacking CLI changes	Stacking CLI changes are introduced to support removable modules on the ICX 7450.	Upgrading to or downgrading from FastIron 08.0.30 on page 13
Stacking flash file changes	The stacking.boot file changes format in this release.	Upgrading to or downgrading from FastIron 08.0.30 on page 13
Unicast Reverse Path Forwarding (uRPF) check	This feature is introduced.	Upgrading to or downgrading from FastIron 08.0.30 on page 13

### TABLE 3 Summary of Enhancements in FastIron Release 08.0.30 (Continued)

# Supported hardware

This guide supports the following product families from Brocade:

FastIron X Series devices (chassis models):

- FastIron SX 800
- FastIron SX 1600
- Brocade FCX Series (FCX) Switch
- Brocade ICX<sup>™</sup> 6610 (ICX 6610) Switch
- Brocade ICX 6430 Series (ICX 6430)
- Brocade ICX 6450 Series (ICX 6450)
- Brocade ICX 6650 series (ICX 6650)
- Brocade ICX 7250 series (ICX 7250)
- Brocade ICX 7450 series (ICX 7450)
- Brocade ICX 7750 series (ICX 7750)

For information about the specific models and modules supported in a product family, refer to the hardware installation guide for that product family.

### NOTE

The Brocade ICX 6430-C switch supports the same feature set as the Brocade ICX 6430 switch unless otherwise noted.

### NOTE

The Brocade ICX 6450-C switch supports the same feature set as the Brocade ICX 6450 switch unless otherwise noted.

Supported hardware

# **Upgrade and Downgrade Considerations**

Upgrading to or downgrading from FastIron 08.0.30	13
Considerations for devices with LAGs	18
Considerations for devices in stack configurations	18
• Upgrade considerations for devices with flexible authentication	19

# Upgrading to or downgrading from FastIron 08.0.30

### NOTE

You must upgrade to the boot code that supports this release. Refer to "Software image files for Release 08.0.xx" in the release notes for detailed information.

The following sections cover the details that should be considered before upgrading to any FastIron 08.0.30 or 08.0.30x release or downgrading to previous releases from FastIron 08.0.30 or 08.0.30x. General changes are indicated by the release number 08.0.30. Changes specific to another release are indicated, for example, as being specific to the 08.0.30b or the 08.0.30d release.

# **Flexible Authentication**

FastIron 08.0.30b introduces the **authentication vlan-mode** and **mac-authentication enabledynamic-vlan** commands. FastIron 08.0.30b also introduces the **authentication max-sessions** command for ICX 7250, ICX 7450, and ICX 7750 devices. These commands have upgrade and downgrade implications as described in Upgrade considerations for devices with flexible authentication on page 19.

# LAG scaling

In FastIron 08.0.30b, the number of LAGs supported on each ICX 7250, ICX 7450, or ICX 7750 increases to 256. When you downgrade from FastIron 08.0.30b, only the first 128 LAGs are deployed. The remaining LAGs are not deployed, and related configuration is lost.

## Symmetric load balancing

In FastIron 08.0.30b, symmetric load balancing is supported. When you downgrade to an earlier release, load balancing becomes asymmetric.

## **VRF ID**

In FastIron 08.0.30b, a new field, VRF-id, is introduced in the flash file dhcpsnoop.txt. When upgrading to FastIron 08.0.30b or a newer version, if the flash file does not contain the VRF-id field, the VRF ID will be determined by the virtual port number. If the virtual port number is not available, the VRF ID will be determined from the VLAN ID.

When you downgrade from FastIron 08.0.30b or a newer release to an older release, the VRF-id field in the flash file will be ignored.

# **BGP4+ Multi-VRF**

Downgrade from FastIron 08.0.30 will cause all BGP VRF6 configuration and previously learned routes to be deleted.

# **Equal Cost Multi-Path**

ECMP is set to 8 by default in FastIron 8.0.30 but may be configured to larger values. Downgrading from FastIron 08.0.30 restores the ECMP default, and previously learned paths are lost. The ranges for ip load-sharing are also reduced. Before downgrading to an earlier release, the customer is advised to reduce the ECMP parameter to 8.

# Flash timeout configuration

The default flash timeout will remain at 12 minutes. Users can change it to any value between 12 and 60 minutes using the **flash-timeout** command. The configured timeout is synced across a stack, and is applied after configuration to the next and all subsequent flash operations. On downgrade from FastIron 08.0.30, the flash timeout returns to the default of 12 minutes.

# ICX 6610 license merge

In FastIron 8.0.30, the advanced features for ICX6610 are available with a premium license. If an advanced license has been previously installed on an ICX 6610, it will function as if it has been upgraded to FastIron 8.0.30. However, if the FastIron 08.0.30 premium license is installed on an ICX 6610 and it is downgraded to an earlier release, the advanced features will be lost. Refer to the *FastIron Ethernet Switch Licensing Guide* for more information on licensing changes.

# ICX 7750 breakout port configuration

FastIron 08.0.30 adds breakout port capability on the ICX 7750, which allows a breakout cable to be applied on a 40-Gbps port and for four 10-Gbps sub-ports to be configured. If you have configured breakout ports and then downgrade to an earlier release, parsing errors are returned during bootup for any port that still has breakout configuration. The configuration for the 10-Gbps ports will be lost after reload, and the port will be returned to 40-Gbps mode.

### NOTE

Cut-through mode is not supported globally if any 40-Gbps port is configured for breakout. The user is prompted to switch to "store-and-forward" mode before breakout CLI can be used.

# ICX 7750 cut-through mode

In FastIron 08.0.30, cut-through mode disables port flow control by default. Previous code enabled incoming port flow control ("honor flow control") by default. Cut-through mode is enabled by default on the ICX 7750, and the **disable port flow** option is disabled by default. To switch modes, store-and-forward must be configured in global configuration mode.

# LAG enhancements

After a downgrade from FastIron 08.0.30 to an earlier release, the configuration is removed from all LAG ports, and the LAG is returned to an undeployed state. Maximum configurable ports per LAG is reduced to eight on downgrade. Brocade recommends that you avoid downgrading from FastIron 08.0.30 to an earlier release if you have configured LAGs. Otherwise, reduce the number of ports per LAG to eight, save the configuration, and then downgrade.

# Layer 3 multicast over MCT

If you have configured Layer 3 multicast routing over MCT and you downgrade from FastIron 08.0.30 to an earlier release, the PIM configurations on MCT member VLAN VEs will be lost.

# Layer 3 unicast routing over MCT

If you have configured Layer 3 unicast routing over MCT and you downgrade from FastIron 08.0.30 to an earlier release, the OSPF configuration on the MCT member VEs will be rejected.

# sflow CLI changes

Several **sflow source** commands are added in FastIron 08.0.30. Their use is documented in the *FastIron Ethernet Switch Administration Guide*. If you configure these commands and then downgrade to an earlier release, the system assumes the default behavior; that is, the IP address of the outgoing interface is used as the source IP address of the sFlow datagram.

# Stacking CLI changes and ICX 7450 10 Gbps stacking

FastIron 08.0.30 introduces 10-Gbps stacking on the ICX 7450. When you downgrade an ICX 7450 from FastIron 08.0.30 to an earlier release and the unit contains 4x10-Gbps stacking configuration, stack-ports are reset to x/3/1 and x/3/4. In addition, these commands may be rejected and return errors: **default-port** and **stack-port**.

### NOTE

MACsec is also introduced on the ICX 7450 in FastIron 08.0.30 on the same 4x10G module. When the module is inserted in slot 2, either MACsec or stacking can be supported on the module, but not both. Refer to the *FastIron Ethernet Switch Stacking Configuration Guide* for more information.

# Stacking image upgrade/downgrade

The flash file stacking.boot is present in every unit in a stack. It may also be present in a standalone unit that has previously been a master stacking unit. Port numbers are not compatible between FastIron 08.0.30 and earlier releases because of the way they are stored in the stacking.boot file. Consequently, if you switch between FastIron 08.0.30 or a later release and any release that pre-dates FastIron 08.0.30, the following message is displayed for an upgrade:

Upgrade stacking.boot from non-breakout to breakout. Modify stacking ports.

The following message is displayed for a downgrade:

Downgrade stacking.boot from breakout to non-breakout. Modify stacking ports.

# Upgrade procedure on the ICX 7750 for uRPF check

Unicast reverse path forwarding (uRPF) check is introduced in FastIron 08.0.30. While there is no preexisting configuration to consider on upgrade, Brocade recommends that users follow these upgrade guidelines. For additional information on configuring uRPF, refer to the *FastIron Ethernet Switch Layer 3 Configuration Guide*.

• uRPF should not be configured on an active device and should not be changed frequently.

Due to hardware limitations, system software automatically reduces **system-max** values by half when uRPF is enabled. As a side-effect, some VRF configuration may be deleted.

Follow this sequence to avoid issues:

- 1. Enable uRPF on an inactive device.
- 2. Reload the device to prepare the hardware for subsequent configuration.
- 3. Configure system-max parameters for routes and VRF as needed. Reload.
- 4. Configure interfaces and any other parameters.

### ICX 7750 downgrade considerations for uRPF check

Brocade recommends that you disable the uRPF feature and remove related configuration before you downgrade to a previous release from FastIron 08.0.30 or a later release. If you downgrade without disabling the feature, existing VRF configuration may be deleted because of changes to system default values and **system-max** limitations. The following **system-max** values are reset to their default values and must be reconfigured after reload:

- ip-route
- ip6-route
- ip-route-default-vrf
- ip6-route-default-vrf
- · ip-route-vrf
- ip6-route-vrf

### **General considerations**

- MACsec in FastIron 08.0.20a and later releases is not compatible with previous versions of the MACsec feature due to changes in CLI functionality. An upgrade is required.
- The **erase startup-config** command erases all startup configuration files (startup-config.txt and also the backup files).
- FSX devices with FastIron 08.0.xx installed, as well as all ICX 6430 and ICX 6450 devices, support
  only one configured system boot preference.
- In an FSX device, using an SX Series 0-Port Third Generation XL management module together with an SX Series 2-Port 10GbE Third Generation XL management module is not supported.
- On an FSX device with the SX Series 0-Port Third Generation XL management module, a hitless
  upgrade from FastIron 08.0.00a or 08.0.01 to 08.0.10 is not supported.
- For ICX 6430 devices, the system-max mac-filter-sys parameter value changed from 512 to 508 in FastIron 08.0.xx. If the current value of system-max mac-filter-sys is more than 508, you should change this value to 508 before upgrading. Otherwise, during upgrade, its value will be set to the default value of 64.
- To use a FastIron 07.x.xx configuration on a device upgraded to a FastIron 08.0.xx image, replacing the running configuration with the FastIron 07.x.xx configuration is not supported. Instead, you must copy the FastIron 07.x.xx configuration onto the startup configuration file and reload the device.

### Deprecated or removed features and commands

- SNTP is no longer supported. NTPv4 replaces SNTP.
- The stack persistent-mac-timer command is deprecated in FastIron 08.0.20.
- The Port Speed Down-Shift feature is deprecated in FastIron 08.0.xx.
- The link-config gig copper autoneg-control down-shift ethernet command is deprecated.
- The show cpu-utilization command replaces the show process cpu command.

### Flash memory capacity

Consider the following limitations of different devices when upgrading software:

- All FastIron devices except ICX 6430 devices can hold two Layer 2 or Layer 3 images (for example, ICX64S08030.bin for Layer 2 and ICX64R08030.bin for Layer 3).
- · ICX 6430 devices can hold only two Layer 2 images.

### Security

- SSHv2 RSA host key format differs between FastIron 07.x.xx and 08.0.xx software versions.
- When you upgrade from FastIron 07.x.xx or 08.0.00 to a FastIron 08.0.xx software version, if an RSA key is present in the FastIron 07.x.xx or 08.0.00 software version, the same size key is regenerated in the FastIron 08.0.xx software version. The old SSHv2 host key is also retained. Old keys can be cleared using the **crypto key zeroize** command.
- SSH host keys created with the DSA method are interoperable with FastIron 07.x.xx, 08.0.00, and 08.0.xx software versions.
- By default, the RADIUS server key encryption type is 2 (simple\_encryption\_base64) in FastIron 08.0.xx. This is in contrast to earlier releases, where the default value for simple\_encryption is 1. If you do not follow the upgrade procedure, the RADIUS server key configuration is removed during downgrade.

### Downgrade considerations

- Any new command in FastIron 08.0.xx is discarded during downgrade.
- The startup configuration as well as the run time changes in a FastIron 08.0.xx configuration are lost during downgrade.
- If software-based licensing is in effect on the device, and if the software is downgraded to a version earlier than FastIron 07.1.00, software-based licensing is not supported.
- SSHv2 RSA host key format differs among FastIron 07.x.xx, 08.0.00, and 08.0.xx software versions.
- On an FSX device with the SX Series 0-Port Third Generation XL management module, a hitless downgrade from FastIron 08.0.10 to 08.0.00a or 08.0.01 is not supported.
- When you downgrade from FastIron 08.0.xx to 08.0.00 or 07.x.xx, consider the following scenarios:
  - When an SSHv2 RSA host key in FastIron 08.0.00a or later is retained from FastIron 07.x.xx or 08.0.00, booting up with FastIron 07.x.xx or 08.0.00 reads the old format SSHv2 RSA host keys and enables the SSHv2 RSA server on the switch.
  - When an SSHv2 RSA host key is created in FastIron 08.0.00a and later, booting up with FastIron 07.x.xx or 08.0.00 software does not read the new format SSHv2 RSA host key, and the SSHv2 server is not enabled on the switch.

# **Considerations for devices with LAGs**

- If you are upgrading to FastIron 08.0.xx and have either LAGs or LACP configured, the previous configuration is automatically updated to form a new equivalent LAG. To accomplish this, the old trunk and link-aggregation commands are maintained during startup configuration parsing but are disabled during normal configurations. The following are the major differences in LAG configuration in FastIron 08.0.xx compared to earlier releases:
  - A LAG is not created until a LAG is deployed using the deploy command.
  - LACP is not started until a dynamic LAG is deployed.
  - The number range for LAG ports is 1 to 8. For FSX third generation modules, the range is 1 to 12.
  - A LAG is created even if a static or dynamic LAG has only one port.
- If link aggregation is configured on your device and you are upgrading to a FastIron 08.0.xx configuration, the link aggregation configuration should have the key configured to identify the LAG. If the key is not configured, when you upgrade to FastIron 08.0.xx, all the link aggregation interfaces (without the key) are bundled as one misconfigured LAG. The configuration will fail if it exceeds the supported maximum number of members per LAG limit.
- All LAG configurations are lost during downgrade.
- In FastIron 08.0.30b, the number of LAGs supported on each ICX 7250, ICX 7450, or ICX 7750 increases to 256. When you downgrade from FastIron 08.0.30b, only the first 128 LAGs are deployed. The remaining LAGs are not deployed, and any related configuration is lost.
- The trunk configuration commands (trunk ethernet, trunk deploy, trunk-cfg-ind, linkaggregation active | passive, link-aggregation conf key) are deprecated. Instead, you can use the new LAG configuration commands.

# **Considerations for devices in stack configurations**

## **Upgrade considerations**

- Hitless stacking is enabled by default for FastIron 08.0.20 and later releases. In previous releases, hitless-failover enable must be configured. Upgrade behavior is as follows:
  - If you install a FastIron 08.0.20 or later image on a new system with no previous configuration, hitless-failover is enabled by default.
  - If you upgrade to FastIron 08.0.20 or later from a previous version that has **hitless-failover** enable configured, hitless-failover is retained as the default.
  - If you upgrade to FastIron 08.0.20 or later on a system with an earlier release that does not have hitless-failover enabled in its configuration, the previous configuration is retained.
- Units in a stack must run the same IPC version to communicate. After an upgrade, verify that the same image is downloaded to every unit in the stack before reloading the entire stack. To verify the images, enter the **show flash** command at any level of the CLI. A stack cannot be built and will not operate if one or more units have different software images.
- A stack cannot form if the software images are of different major versions. A stack member is not
  operational if it runs a different minor version from other stack members; however, the active
  controller can download an image and reset a non-operational unit that has a minor version number
  different from the active controller.
- The Layer 3 configuration on your device becomes part of the default VRF after upgrade. If no configurations are done, all interfaces are part of the default VRF.

# Upgrade considerations for devices with flexible authentication

The following behavior associated with flexible authentication should be taken into consideration when you upgrade to FastIron 08.0.20 or later.

#### NOTE

Some behavioral differences occur when you upgrade to FastIron 08.0.30b as indicated in the following sections.

· Dot1x authentication and MAC authentication configured on default VLAN

After you upgrade to FastIron 08.0.20 or later, global configuration for both dot1x authentication and MAC authentication move under the **authentication** command, and the first unused VLAN becomes auth-default-vlan (the authentication default VLAN), VLAN 2 in the following example. Interface level configuration for dot1x authentication and MAC authentication conform to any new CLI changes that are part of the upgrade.

For example, before upgrade, with dot1x authentication enabled on port 2/1/24 and MAC authentication enabled on 2/1/23 globally and at the interface level, the configured ports are part of the default VLAN. After upgrade, since port 2/1/23 and 2/1/24 are part of the default VLAN, they become part of the auth-default-vlan, VLAN 2 in this example.

```
vlan 1 name DEFAULT-VLAN by port >> 2/1/24 and 2/1/23 ports are part of default vlan
vlan 3 by port
tagged ethe 1/1/5
vlan 100 by port
tagged ethe 1/1/9
 untagged ethe 1/1/18
vlan 200 by port
untagged ethe 1/1/15
vlan 201 by port
dot1x-enable >> global configuration
enable ethe 2/1/24
mac-authentication enable >> global configuration
mac-authentication auth-passwd-format xxxx.xxxx
interface ethernet 2/1/24 >> interface level
dot1x port-control auto
interface ethernet 2/1/23 >> interface level
mac-authentication enable
mac-authentication max-accepted-session 32
```

The following example shows the configuration after the upgrade.

vlan 1 name DEFAULT-VLAN by port
!
vlan 2 by port
!
vlan 3 by port
tagged ethe 1/1/5
!
vlan 100 by port
tagged ethe 1/1/9
untagged ethe 1/1/18
!
vlan 200 by port
untagged ethe 1/1/15
!

 Dot1x authentication and MAC authentication configured on a VLAN other than the default VLAN

After you upgrade to FastIron 08.0.20 or later, global configuration for both dot1x authentication and MAC authentication move under the **authentication** command, and the first unused VLAN becomes auth-default-vlan, VLAN 2 in the following example.

For example, before upgrade, with dot1x authentication enabled globally on port 2/1/24 and MAC authentication enabled globally on port 2/1/23, the configured ports are part of VLANs 600 and 601. After upgrade, VLAN 600 becomes the auth-default-vlan for prot 2/1/24, and 601 becomes the auth-default-vlan for port 2/1/24.

```
vlan 1 name DEFAULT-VLAN by port
vlan 3 by port
tagged ethe 1/1/5
vlan 100 by port
tagged ethe 1/1/9
untagged ethe 1/1/18
vlan 200 by port
untagged ethe 1/1/15
vlan 201 by port
vlan 600 by port
untagged ethe 2/1/24
vlan 601 by port
untagged ethe 2/1/23
dot1x-enable >> global configuration
enable ethe 2/1/24
mac-authentication enable >> global configuration
mac-authentication auth-passwd-format xxxx.xxxx.xxxx
interface ethernet 2/1/24 >> interface level
dot1x port-control auto
interface ethernet 2/1/23 >> interface level
mac-authentication enable
mac-authentication max-accepted-session 32
```

The following example shows the configuration after the upgrade.

```
vlan 1 name DEFAULT-VLAN by port
!
vlan 2 by port
!
vlan 3 by port
tagged ethe 1/1/5
```

```
vlan 100 by port
tagged ethe 1/1/9
 untagged ethe 1/1/18
vlan 200 by port
untagged ethe 1/1/15
vlan 201 by port
vlan 600 by port >> 2/1/24 should be removed
vlan 601 by port >> 2/1/23 should be removed
authentication
auth-default-vlan 2
dot1x enable
dot1x enable ethe 2/1/24
mac-authentication enable
mac-authentication enable ethe 2/1/23
mac-authentication password-format xxxx.xxxx
interface ethernet 2/1/24
authentication auth-default-vlan 600
dot1x port-control auto
interface ethernet 2/1/23
authentication auth-default-vlan 601
authentication max-sessions 32
```

### · Dot1x authentication and MAC authentication configured on a voice VLAN

After you upgrade to FastIron 08.0.20 or later, global configuration for both dot1x authentication and MAC authentication moves under the **authentication** command, and the first unused VLAN moves as auth-default-vlan (the authentication default VLAN), VLAN 2 in the following example. Any **dual-mode** commands on the interface are replaced by the auth-default-vlan at the interface level. The **voice-vlan** command remains the same.

For example, before upgrade, with dot1x authentication enabled globally on port 2/1/24 and MAC authentication enabled globally on port 2/1/23, the configured ports are part of VLANs 100 and 200 respectively as tagged. Both of these ports are also part of voice-vlan VLAN 1000 as tagged. After upgrade, VLAN 100 becomes auth-default-vlan for port 2/1/24, and VLAN 200 becomes auth-default-vlan for port 2/1/23. The **voice-vlan** *1000* command is retained.

```
vlan 1 name DEFAULT-VLAN by port
vlan 3 by port
tagged ethe 1/1/5
.
vlan 100 by port
tagged ethe 1/1/9 ethe 2/1/24
 untagged ethe 1/1/18
!
vlan 200 by port tagged ethe 2/1/23
 untagged ethe 1/1/15
vlan 1000 by port
tagged ethe 2/1/23 to 2/1/24
dot1x-enable >> global configuration
enable ethe 2/1/24
mac-authentication enable >> global configuration
mac-authentication auth-passwd-format xxxx.xxxx.xxxx
interface ethernet 2/1/24 >> interface level
dot1x port-control auto
dual-mode 100
voice-vlan 1000
interface ethernet 2/1/23 >> interface level
```

```
mac-authentication enable
mac-authentication max-accepted-session 32
dual-mode 200
voice-vlan 1000
```

The following example shows the configuration after the upgrade.

```
FCX Stack(2U) # sh run vlan
vlan 1 name DEFAULT-VLAN by port
vlan 2 by port
vlan 3 by port
tagged ethe 1/1/5
vlan 100 by port
tagged ethe 1/1/9
                     >> 2/1/24 should be removed
untagged ethe 1/1/18
vlan 200 by port >> 2/1/23 should be removed untagged ethe 1/1/15
vlan 1000 by port
tagged ethe 2/1/23 to 2/1/24
authentication
auth-default-vlan 2
dot1x enable
dot1x enable ethe 2/1/24
mac-authentication enable
mac-authentication enable ethe 2/1/23
 mac-authentication password-format xxxx.xxxx
interface ethernet 2/1/24
authentication auth-default-vlan 100
dot1x port-control auto
voice-vlan 1000
interface ethernet 2/1/23
authentication auth-default-vlan 200
authentication max-sessions 32
voice-vlan 1000
!
```

## **Flexible Authentication**

The **authentication vlan-mode** command introduced in FastIron 08.0.30b affects upgrade and downgrade as summarized in the following tables.

Upgrade scenario	vlan-mode	Comments
FastIron 08.0.10 to FastIron 08.0.20	Multiple untagged	Port can be part of multiple VLANs.
FastIron 08.0.10 to FastIron 08.0.30b or later	Single untagged	After upgrade, the default behavior is single untagged.
		If required, this default behavior can be changed to multiple untagged using the new CLI.
FastIron 08.0.20 to FastIron 08.0.30b or later	Single untagged. There will not be any change in configuration.	After upgrade, the default behavior is single untagged.
		If required, this default behavior can be changed to multiple untagged.

**TABLE 4** Flexible authentication upgrade results

Downgrade scenario	vlan-mode	Comments
FastIron 08.0.30b to FastIron 08.0.20	Multiple untagged	The new authentication vlan-mode command configuration is lost.
FastIron 08.0.30b to FastIron 08.0.10x	Single untagged	All flexible authentication configuration is lost. You must reconfigure as per CLI syntax in FastIron 08.0.10x.
FastIron 08.0.20 to FastIron 08.0.10x	Single untagged	All flexible authentication configuration is lost. You must reconfigure as per CLI syntax in FastIron 08.0.10x.

TABLE 5	Flexible authentication downgrade results

FastIron 08.0.30b introduces support for the **authentication max-sessions** command on ICX 7250, ICX 7450, and ICX 7750 devices. Consequently, when you upgrade to or downgrade from FastIron 08.0.30b or a newer release, CLI behavior changes. The following tables summarize changes for different FastIron devices.

**TABLE 6** Upgrade behavior for the authentication max-sessions command

Upgrade scenario	Behavior	Comment
FastIron 08.0.10 to FastIron 08.0.20	Maximum = 32 users	The default is 2 for ICX6610, FCX, ICX6430, and ICX 6450 devices. The maximum can be set to 32. For ICX 7450 and ICX 7750 devices, the default is 32 and cannot be changed.
FastIron 08.0.10 to FastIron 08.0.30b or later	Default = 2 users	Can be configured as a larger number, maximum 256 or 1024, depending on the type of device.
FastIron 08.0.20 to FastIron 08.0.30b or later	Default = 2 users	Can be configured as a larger number, maximum 256 or 1024, depending on the type of device.

<b>TABLE 7</b> Downgrade behavior for the authentication max-sessions comman
--

5		
Downgrade scenario	Behavior	Comment
FastIron 08.0.30b to FastIron 08.0.20x	Maximum = 32 users	Configuration lost on downgrade when max-sessions configured value is greater than 32.
FastIron 08.0.30b to FastIron 08.0.10x	Maximum = 250 users	Configuration lost on downgrade.
FastIron 08.0.20 to FastIron 08.0.10x	Maximum = 250 users	Configuration lost on downgrade.

Refer to the *FastIron Ethernet Switch Security Configuration Guide* for more information on flexible authentication.

Upgrade considerations for devices with flexible authentication

# Software Upgrade and Downgrade

Software upgrade overview	
Initial steps	
Upgrade process	
Downgrade process	
Loading images on the device	
Software recovery	

# Software upgrade overview

Follow these steps to upgrade software.

- 1. Determine the current software versions and license requirements, and download the software as described in Initial steps on page 25.
- 2. Upgrade the software as described in Upgrade process on page 27.

FastIron 08.0.00a and later also support manifest file upgrade, but this process can be used only to upgrade to a later release. For more information, refer to Upgrade using a manifest file on page 29.

# **Initial steps**

Perform the following steps before an upgrade or downgrade.

### NOTE

You must upgrade to the boot code that supports this release. Refer to "Software image files for Release 08.0.xx" in the release notes for detailed information.

#### NOTE

In this section, the output is truncated. Only relevant portions of the output is displayed. For detailed output, see Sample output - determining the software versions on page 26.

1. Determine the current boot image version using the show flash command.

```
device# show flash
Active Management Module (Slot 9):
Compressed Pri Code size = 3613675, Version 03.1.00aT3e3 (sxr03100a.bin)
Compressed Sec Code size = 2250218, Version 03.1.00aT3e1 (sxs03100a.bin)
Compressed BootROM Code size = 524288, Version 03.0.01T3e5
Code Flash Free Space = 9699328
<output is truncated to show relevant sections only>
```

2. Determine the current flash image version using the show version command.

```
device# show version
Copyright (c) 1996-2012 Brocade Communications Systems, Inc. All rights reserved.
UNIT 1: compiled on Mar 2 2012 at 12:38:17 labeled as ICX64S07400
(10360844 bytes) from Primary ICX64S07400.bin
```

```
SW: Version 07.4.00T311
Boot-Monitor Image size = 774980, Version:07.4.00T310 (kxz07400)
HW: Stackable ICX6450-24
<output is truncated to show relevant sections only>
```

3. Determine the current license installed using the **show version** command.

```
device# show version
...
License: BASE_SOFT_PACKAGE (LID: dbuFJJHiFFi)
P-ENGINE 0: type DEF0, rev 01
...
```

<output is truncated to show relevant sections only>

- 4. Generate a new license, if required, from the Software License page on Brocade.com. If you are upgrading to a different type of image that uses a different license from the one already installed on the device, generate a separate license file. For more information on licenses, refer to the FastIron Ethernet Switch Licensing Guide.
- 5. Download the required software images from the Downloads page on the MyBrocade website. For the list of software image files available for FastIron 08.0.xx, refer to the release notes.

### Determining the software versions (sample output)

This section provides examples to help you determine the following:

- · flash image version
- boot image versions
- current licenses installed.

### Determining the flash image version

To determine the flash image version, enter the show version command at any level of the CLI.

```
device# show version
Copyright (c) 1996-2012 Brocade Communications Systems, Inc. All rights reserved.
   UNIT 1: compiled on Mar 2 2012 at 12:38:17 labeled as ICX64S07400
             (10360844 bytes) from Primary ICX64S07400.bin
      SW: Version 07.4.00T311
 Boot-Monitor Image size = 774980, Version:07.4.00T310 (kxz07400)
 HW: Stackable ICX6450-24
                                      _____
UNIT 1: SL 1: ICX6450-24 24-port Management Module
       Serial #: BZSXXXXXXXXX
                               (LID: dbuFJJHiFFi)
       License: BASE_SOFT_PACKAGE
       P-ENGINE 0: Type DEF0, rev 01
                                  _____
UNIT 1: SL 2: ICX6450-SFP-Plus 4port 40G Module
_____
 800 MHz ARM processor ARMv5TE, 400 MHz bus
65536 KB flash memory
 512 MB DRAM
STACKID 1 system uptime is 3 minutes 39 seconds
The system : started=warm start reloaded=by "reload"
```

In the previous example:

- "07.4.00T311" indicates the flash code version number.
- "labeled as ICX64S07400" indicates the flash code image label. The label indicates the image type and version and is especially useful if you change the image file name.
- "Primary ICX64S07400.bin" indicates the flash code image file name that was loaded.
- "License: BASE\_SOFT\_PACKAGE (LID: dbuFJJHiFFi)" indicates the license currently installed on the device.

### Determining the boot image versions

To determine the boot and flash images installed on a device, enter the **show flash** command at any level of the CLI.

device# show flash Active Management Module (Slot 9): Compressed Pri Code size = 3613675, Version 03.1.00aT3e3 (sxr03100a.bin) Compressed Sec Code size = 2250218, Version 03.1.00aT3e1 (sxs03100a.bin) Code Flash Free Space = 9699328 Standby Management Module (Slot 10): Compressed Pri Code size = 3613675, Version 03.1.00aT3e3 (sxr03100a.bin) Compressed Sec Code size = 2250218, Version 03.1.00aT3e1 (sxs03100a.bin) Compressed BootROM Code size = 524288, Version 03.0.01T3e5 Code Flash Free Space = 524288, Version 03.1.00aT3e1 (sxs03100a.bin)

In the previous example:

- The "Compressed Pri Code size" line lists the flash code version installed in the primary flash area.
- The "Compressed Sec Code size" line lists the flash code version installed in the secondary flash area.
- The "Compressed BootROM Code size" line lists the boot code version installed in flash memory. The device does not have separate primary and secondary flash areas for the boot image. The flash memory module contains only one boot image.

### Determining the current licenses installed

Use the show version command to display the licenses installed on the device.

In the previous example, a base software package license is installed, with a license ID of dbuFJJHiFFi.

# **Upgrade process**

FastIron 08.0.xx introduces several new features and enhancements across all FastIron products. Before upgrading the software on the device, refer to Upgrade and Downgrade Considerations on page 13.

#### NOTE

If you are upgrading from FastIron 08.0.00a or later, you can upgrade using a manifest file. It provides a simplified upgrade mechanism, especially for units in a stack. For details, refer to Upgrade using a manifest file on page 29.

# Software upgrade on ICX 6430, ICX 6450, ICX 6610, ICX 6650, ICX 7250, ICX 7450, ICX 7750, and FCX devices

### NOTE

For limitations on upgrading an ICX 6650 device from FastIron 07.5.xx to 08.0.xx, refer to Software upgrade from 07.5.xx to 08.0.01 on page 29.

- Load the boot code and flash code. For detailed steps, refer to Loading images on the device on page 34.
- Enter the write memory command to back up the existing startup configuration and to save the running configuration as the startup configuration. The existing startup configuration file, startupconfig.txt, is automatically copied and synched to the standby unit.

### NOTE

When a device boots up with a FastIron 08.0.xx image after an upgrade, the commands in the startup configuration are converted to corresponding FastIron 08.0.xx commands. The running configuration will have supported FastIron 08.0.xx commands, and the startup configuration file will have the configuration commands supported in the releases prior to FastIron 08.0.xx. When you enter the **write memory** command, the startup configuration file (startup-config.txt) is first backed up as the startup-config.legacy file. Then the running configuration file is saved as the startup configuration. The backup configuration file (startup-config.legacy) is used when you downgrade to an earlier version.

### Software upgrade on FSX devices

On FastIron SX series devices, the old management module does not support FastIron 08.0.xx. The FastIron SX Series 0-Port Third Generation XL Management Module supports only FastIron 08.0.00a or later versions, and the FastIron SX Series 2-Port 10GbE Third Generation XL Management Module supports only FastIron 08.0.10 or later versions.

### NOTE

For FSX devices, you can perform a hitless upgrade to a minor or patch release. For details, refer to "Hitless management on the FSX 800 and FSX 1600" in the *FastIron Ethernet Switch Administration Guide*.

To upgrade an FSX device to FastIron 08.0.xx, perform the following steps.

1. Verify that the currently installed management module supports FastIron 08.0.xx. If it does not, uninstall the management module and install a management module that supports the release. For information on installing a management module in FSX, refer to the *Brocade FastIron SX Series Chassis Hardware Installation Guide*.

### NOTE

If you have installed a management module that was factory-loaded with the required software version, the upgrade is complete, and you can skip the next step.

- 2. Load the required boot code. For detailed steps, refer to Loading images on the device on page 34.
- 3. Load the required flash code. For detailed steps, refer to Loading the flash code on page 35.

### NOTE

When upgrading an FSX device with the FastIron SX Series 0-Port Third Generation XL Management Module from FastIron 08.0.0x to 08.0.10 or 08.0.10a, download the flash image to the primary flash only. Downloading the flash image to the secondary flash is not supported. Reload the device with the **boot system flash primary** command to boot from the primary flash. After reload, the device automatically copies the image to the secondary flash. After a successful upgrade to FastIron 08.0.10 or 08.0.10a, downloading a later software version to the secondary as well as primary flash is supported; however, a mix of FastIron 08.0.10 or 08.0.10a and an earlier version image in the flash partitions is not supported.

### Software upgrade from FastIron 07.5.xx to 08.0.01

The following limitations are applicable when upgrading from FastIron 07.5.xx to 08.0.01:

- When you load the FastIron 08.0.01 boot code on a FastIron device with FastIron 07.5.xx installed, the device loses all boot environment variables. As a result, you cannot use the **boot system flash primary** or **boot system flash secondary** commands to configure boot preference. The device also ignores any boot preference stated in the startup configuration file. As a result, the device boots from the default primary flash. This is only an upgrade limitation. Once the upgrade is complete, the device boots from the preferred flash partition as configured.
- You must load the primary as well as the secondary flash with the FastIron release 08.0.01 flash image. A mix of FastIron 07.5.xx and FastIron 08.0.01 images in the flash partitions is not supported.

### Upgrade using a manifest file

FastIron 08.0.00a introduces a manifest file to provide a simplified upgrade mechanism from FastIron 08.0.00a to later releases, especially for units in a stack. You can use a single command to copy boot and flash images. Using the official manifest file, the images are copied onto the devices, and all member units are upgraded.

### NOTE

These devices support software upgrades using a manifest file for standalone devices as well as for homogeneous and mixed stacks: FCX, ICX 6430, ICX 6450, ICX 6610, ICX 6650, ICX 7450, and ICX 7750 devices.

### NOTE

The manifest file upgrade process is only applicable when you upgrade a device from FastIron 08.0.00a to a later version. For upgrade from FastIron 07.x.xx to FastIron 08.0.xx, refer to Upgrade process on page 27.

- Unzip the downloaded FastIron image files on the TFTP server. This places the manifest file at the top of the directory structure with the images in subdirectories. Ensure that the Brocade device has access to the TFTP server.
- 2. If upgrading from FastIron 08.0.00x, delete the following lines from the manifest text file.

```
-DIRECTORY /RP/Boot
fxz08001b007.bin
-DIRECTORY /RP/Images
ICXS08001q033.bin
ICXR08001q033.bin
```

```
-DIRECTORY /RP/Signatures
fxz08001b007.sig
ICXS08001q033.sig
ICXR08001q033.sig
-DIRECTORY /RP/MIBs
ICXS08001q033.mib
ICXR08001q033.mib
```

3. If upgrading to FastIron 08.0.10, delete the following lines from the manifest text file.

```
-DIRECTORY /ICX7750/Boot
swz10100.bin
-DIRECTORY /ICX7750/Images
SWS08010.bin
-DIRECTORY /ICX7750/Signatures
swz10100.sig
SWS08010.sig
-DIRECTORY /ICX7750/MIBs
SWS08010.mib
SWS08010.mib
```

```
-DIRECTORY /ICX7750/Manuals
```

4. If the FastIron device has only 8 MB of flash memory or if you want to install a full Layer 3 image on a device, delete the primary and secondary images before upgrading the image.

### NOTE

Make sure that the TFTP server and the image files are reachable before deleting the image from flash. If the primary flash contains additional files that are not related to the software update, those files should also be deleted.

- 5. The manifest file upgrade process does not support downloading boot images in a mixed stack. If a newer boot image version is available, load the boot code manually in the stack units of a mixed stack. For detailed steps, refer to Upgrade process on page 27.
- 6. Enter the following commands to copy the manifest file and the images from the TFTP server to the device:

copy tftp system-manifest server-ip-address manifest-file-name [ primary | secondary ]

or

copy tftp system-manifest server-ip-address manifest-file-name [ all-images-primary | all-images-secondary ]

For example:

Brocade # copy tftp system-manifest 192.168.10.12 manifest.txt primary

You can use the all-images-primary and all-images-secondary options to copy all the images.

#### NOTE

Copying the manifest file using SCP is not supported.

#### NOTE

For standalone devices or a homogeneous stack, the manifest upgrade process downloads the boot image to the device only if a newer boot image version is available.

The manifest file specifies images for both router and switch types. Based on the device family and the type of image (switch or router), the appropriate images are installed.

After all the relevant images have been installed on the device, you are prompted to reboot the device to complete the upgrade process.

### Example of a manifest file upgrade

```
Brocade# copy tftp system-manifest 10.20.65.49 FI08000B3 Manifest.txt all-images-
primary
You are about to download boot image and boot signature image as well, ARE YOU SURE? (enter 'y' or 'n'): y

# **Downgrade process**

Before downgrading the software on the device, refer to Upgrade and Downgrade Considerations on page 13.

# Software downgrade on ICX 6430, ICX 6450, ICX 6610, ICX 6650, and other FCX devices

1. If you are downgrading from FastIron 08.0.30 to a FastIron 7.x.40 release that the device was upgraded from, enter the **downgrade\_to** command at the privileged EXEC level. This funky command renames the backup startup-config.legacy file as startup-config.txt and underwrites the existing startup configuration file.

```
Brocade# downgrade_to 7.x-releases
This operation will delete the current configuration. Are you sure? (enter 'y' or 'n'):
```

### NOTE

Do not run the **write memory** command after using the **downgrade\_to** command; otherwise, you will lose the legacy configuration. Use another command.

#### NOTE

The **downgrade\_to** command renames the backup configuration file startup-config.legacy as startup-config.txt, which overwrites the FastIron 08.0.xx startup configuration file. If there is no startup-config.legacy file, the device boots with the default configuration. During downgrade, the FastIron 08.0.xx startup configuration file is not saved. You can manually back up the startup configuration file if required.

#### NOTE

If you reboot from a flash partition that has a FastIron image version (earlier than FastIron 08.0.xx) without running the **downgrade\_to** command, a warning message prompts you to enter the **downgrade\_to** command.

2. Load an earlier version of the boot code and flash code. Refer to Loading images on the device on page 34.

### NOTE

If you are downgrading an ICX 6650 from Fastiron 08.0.01 to FastIron 07.5.xx, refer to Loading images on the device on page 34.

#### NOTE

For downgrading ICX 6430, ICX 6450, ICX 6610, and FCX devices, it is not mandatory to load an earlier version of the boot code.

# Software downgrade on FSX devices

On FastIron SX series devices, the old management module does not support FastIron 08.0.xx releases. The FastIron SX Series 0-Port Third Generation XL Management Module supports only FastIron 08.0.00a or later. The FastIron SX Series 2-Port 10GbE Third Generation XL Management Module supports only FastIron 08.0.10 or later.

### NOTE

For FSX devices, you can perform a hitless downgrade if the current software is a minor upgrade or a patch release to the lower software version. For details, refer to "Hitless management on the FSX 800 and FSX 1600" in the *FastIron Ethernet Switch Administration Guide*.

To downgrade an FSX device, perform the following steps.

 Check whether the currently installed management module supports the earlier software version. If not, uninstall the management module, and install the correct management module. For information on installing the management module in an FSX device, refer to the *Brocade FastIron SX Series Chassis Hardware Installation Guide*.

### NOTE

If you have installed a management module that was factory-loaded with the required software version, skip the next step, as the downgrade is complete.

- 2. Load the required boot code. For detailed steps, refer to Loading images on the device on page 34.
- 3. Load the required flash code. For detailed steps, refer to Loading the flash code on page 35.

### NOTE

When downgrading an FSX device with the FastIron SX Series 0-Port Third Generation XL Management Module from FastIron 08.0.10 or FastIron 08.0.10a to FastIron 08.0.0x, download the 08.0.0x flash image to the primary flash only. Downloading the 08.0.0x flash image to the secondary flash is not supported. Reload the device with the **boot system flash primary** command to boot from the primary flash. After reload, enter the **copy flash flash secondary command** to copy the 08.0.0x image to the secondary flash. After a successful downgrade to FastIron 08.0.0x, downloading a different FastIron 08.0.0x release to the secondary as well as primary flash is supported; however, a mix of FastIron 08.0.10 or 08.0.10a and an earlier version image in the flash partitions is not supported.

### Software downgrade from FastIron 08.0.01 to FastIron 07.5.xx

Note the following while downgrading from FastIron 08.0.01 to FastIron 07.5.xx:

- You must load the primary as well as the secondary flash with the 07.5.xx flash image. A mix of 07.5.xx and 08.0.01 images in the flash partitions is not supported.
- After loading the 07.5.xx boot and flash images, reboot the device. Then load just the 07.5.xx flash
  image again and reboot the device. This completes the downgrade process.

# Loading images on the device

Any software upgrade or downgrade requires you to copy the downloaded images onto the device and load the new image on the device. You must load the boot code and flash code on the device.

### Software upgrade and downgrade file transfers

Software images for all Brocade devices can be uploaded and downloaded between flash modules on the devices and a TFTP server on the network.

Brocade devices have two flash memory modules:

- · Primary flash The default local storage device for image files and configuration files
- Secondary flash A second flash storage device. You can use secondary flash to store redundant images for additional booting reliability or to preserve one software image while testing another one.

Only one flash device is active at a time. By default, the primary image becomes active when you reboot the device.

You can use TFTP to copy an update image from a TFTP server onto a flash module. You can also use SCP to copy images to and from a host. When you want to back up the current configuration and images for a device, you can copy the images and configuration files from a flash module to a TFTP server.

### NOTE

Brocade devices are TFTP clients, not TFTP servers. You must perform a TFTP transaction from the Brocade device.

### Loading the boot code

You can load the boot code using either TFTP or SCP as described in the following sections.

### NOTE

To upgrade FastIron 07.3.00f to 08.0.xx or FastIron 08.0.00a to 08.0.01, it is strongly recommended that you use SCP to reliably and securely load boot code. To upgrade FastIron 07.4.xx to 08.0.xx or FastIron 07.5.xx to 08.0.01, use TFTP to ensure that you have no network disruptions during upgrade.

### Loading the boot code using TFTP

- Place the new boot code on a TFTP server to which the Brocade device has access.
- If the device has only 8 MB of flash memory or if you want to install a full Layer 3 image on an FCX or FSX device, delete both the primary and secondary images using the **erase flash** command.
- 3. Enter the following command at the privileged EXEC level of the CLI to copy the boot code from the TFTP server into flash memory:

#### copy tftp flash ip-addr image-file-name bootrom

For example:

Brocade # copy tftp flash 192.168.10.12 grz07302.bin bootrom

FSX, FCX, and ICX 6610 devices generate an output similar to the following:

```
Brocade # Flash Memory Write (8192 bytes per dot) ......
(Boot Flash Update)Erase.....Write.....
TFTP to Flash Done
```

ICX 6430 and ICX 6450 devices generate an output similar to the following:

#### NOTE

It is recommended that you use the **copy tftp flash** command to copy the boot code to the device during a maintenance window. Attempting to do so during normal networking operations may cause disruption to your network.

4. Verify that the code has been successfully copied by using the show flash command at any level of the CLI to check the boot code version. The output displays the compressed boot ROM code size and the boot code version.

### Loading the boot code using SCP

- 1. Place the new boot code on an SCP-enabled host to which the Brocade device has access.
- 2. If the device has only 8 MB of flash memory, or if you want to install a full Layer 3 image, delete both the primary and secondary image using the **erase flash** command.
- 3. Enter the following command to copy the boot code from the SCP-enabled host into flash memory:

pscp image-file-name hostname@management-ip:flash:bootrom

For example:

C: > pscp grz07302.bin terry@10.168.1.50:flash:bootrom

4. Verify that the code has been successfully copied onto the device by using the show flash command at any level of the CLI. The output displays the compressed boot ROM code size and the boot code version.

### Loading the flash code

You can load the flash code using either TFTP or SCP as described in the following sections.

#### NOTE

It is strongly recommended that you use SCP for reliable and secure loading of flash code.

### Loading the flash code using TFTP

- 1. Place the new flash code on a TFTP server to which the Brocade device has access.
- If the device has only 8 MB of flash memory, or if you want to install a full Layer 3 image, make sure that the TFTP server and the image file are reachable and then delete the primary and secondary images before proceeding.

#### NOTE

If the primary flash contains additional files that are not related to the software update, it is recommended that these files also be deleted.

Enter the following command at the privileged EXEC level of the CLI to copy the flash code from the TFTP server into flash memory.

#### copy tftp flash ip-addr image-file-name primary | secondary

For example,

Brocade # copy tftp flash 192.168.10.12 TIS07300f.bin primary

FSX, FCX, and ICX 6610 devices generate an output similar to the following:

Device# Flash Memory Write (8192 bytes per dot) ..... TFTP to Flash Done

ICX 6430 and ICX 6450 devices generate an output similar to the following:

Verify the flash image version by using the show flash command at any level of the CLI.

#### NOTE

When upgrading the flash image version, the image is automatically updated across all stack units. For other devices, when upgrading from one major release to another (for example, from FastIron 07.1.00 to 07.2.00), make sure that every unit in the traditional stack has the same code. If you reboot the stack while units are running different code versions, the units will not be able to communicate.

- 5. Reboot the device using the reload or boot system command.
- 6. Verify that the new flash image is running on the device by using the show version command.

### Loading the flash code using SCP

- 1. Place the new flash code on an SCP-enabled host to which the Brocade device has access.
- 2. If the device has only 8 MB of flash memory, or if you want to install a full Layer 3 image, delete the primary and secondary images before upgrading the image. If the primary flash contains additional files that are not related to the software update, delete these files also.
- 3. Copy the flash code from the SCP-enabled host into the flash memory using the following methods.
  - · Copy the flash code using SCP tool using the following command.

### scp image-file-name hostname@management-ip:flash:primary | secondary

Or, if you also want to specify the name for the image file on the FastIron device, enter the following command:

**scp** *image-file-name-on-scp-host hostname@management-ip*:**flash**:**pri** | **sec**:*image-file-name-ondevice* 

#### NOTE

The *image-file-name-on-device* variable is case-insensitive and converts any uppercase characters in the image file name to lowercase characters.

```
For example:
```

```
C:\> scp SPS08030.bin terry@10.168.1.50:flash:primary
or
C:\> scp SPS08030.bin terry@10.168.1.50:flash:pri:SPS08030.bin
or
C:\> scp SPS08030.bin terry@10.168.1.50:flash:secondary
or
C:\> scp SPS08030.bin terry@10.168.1.50:flash:sec:SPS08030.bin
```

Copy the flash code using PSCP tool.

pscp image-file-name hostname@management-ip:flash:primary | secondary

D:\Images>pscp.exe SPS08030.bin brocade@172.26.67.84:flash:primary

#### NOTE

On ICX 6430 and ICX 6450 devices, you can use the same syntax as for FCX devices. However, after the copy operation is completed at the host, you do not get the command prompt back because the device is synchronizing the image to flash. To ensure that you have successfully copied the file, enter the **show flash** command. If the copy operation is not complete, the **show flash** command output shows the partition (primary or secondary) as EMPTY.

- 4. Verify that the flash code has been successfully copied onto the device by using the **show flash** command at any level of the CLI.
- 5. Reboot the device using the reload or boot system command.
- 6. Verify that the new flash image is running on the device by using the show version command.

## Software recovery

If the software upgrade or downgrade fails, the device may reboot continuously as shown in the following CLI ouput:

```
bootdelay: ===
Booting image from Primary
Bad Magic Number
could not boot from primary, no valid image; trying to boot from secondary
Bad Magic Number
## Booting image at 01fffc0 ...
Bad Magic Number
## Booting image at 01fffc0 ...
Bad Magic Number
could not boot from secondary, no valid image; trying to boot from primary
Bad Magic Number
## Booting image from Primary
Bad Magic Number
## Booting image at 01fffc0 ...
Bad Magic Number
```

This section explains how to recover devices from image installation failure or deleted or corrupted flash images.

#### NOTE

Software recovery should be performed under the supervision of a Brocade support engineer.

## Software recovery on FCX and ICX 6610 devices

#### NOTE

In practice, the TFTP server is also used as the terminal server to see the CLI output.

- 1. Connect a console cable from the console port to the terminal server.
- Connect an Ethernet cable from the management port (port located under the console port on the device) to the TFTP server.
- 3. On the TFTP server, assign an IP address to the connected NIC; for example, 10.10.10.1 mask 255.255.255.0.
- 4. Reboot the device, and go to the boot monitor mode by pressing "b "; for example:

```
BOOT INFO: RESET ACTIVE
master arbitrate : become primary arbitrator.
BOOT INFO: Become active CPU module
M2 BI Boot Code Version 07.06.05
Enter 'b' to go to boot monitor ...
BOOT MONITOR>
```

Set a temporary IP address from the same subnet as the TFTP server NIC for the device management port using the **ip address** command; for example:

```
BOOT MONITOR> ip address 10.10.10.2/24
BOOT INFO: set ip addr to 10.10.10.2, ip mask to 255.255.255.000
```

Test the connectivity from the device to the TFTP server using the **ping** command to ensure a working connection; for example:

BOOT MONITOR> ping 10.10.10.1 Reply from 10.10.10.1 : bytes=100 time=1ms TTL=64

Enter the following command to boot from the image on a TFTP server that hosts a valid software image:

boot system tftp ip-address image-file-name

For example:

all modules ...

Init Management module 1 ... Init DMA 1.. 2.. 3.. 4.. Init module 5 ... Init DMA 1.. 2.. 3..

Brocade # boot system tftp 192.168.1.200 FCXR08000.bin

You will get an output similar to the following:

```
BOOT MONITOR>
BOOT MONITOR> boot system tftp 192.168.1.200 FCXR08000.bin
BOOT INFO: try to boot thru tftp 192.168.001.200, FCXR08000.bin
BOOT INFO: tftp copy successful!
BOOT INFO: bootparam at 27ffffe0, mp_flash_size = 002d022b
BOOT INFO: code decompression completed
BOOT INFO: start with hardware reset
BOOT INFO: branch to 20000104
```

Reset

Parsing Config Data ... Load config data from flash memory... SW: Version 08.0.00acT5 Copyright (c) 1996-2004 Foundry Networks, Inc. Compiled on Apr 06 2013 at 20:13:29 labeled as FCXR08000 (2949675 bytes) from Tftp

8. Copy the image from the TFTP server to the primary and secondary flash partition using the copy tftp flash *ip-address image-file-name* primary | secondary command; for example: copy tftp flash 192.168.1.200 FCXR08000.bin primary

9. Enter the **show flash** command to check whether the image copy process was successful.

10 Reboot the device using the **reload** command.

## Software recovery on ICX 6430, ICX 6450, ICX 6650, ICX 7450, ICX 7750, and FSX devices

#### NOTE

In practice, the TFTP server is also used as the terminal server to see the CLI output.

- 1. Connect a console cable from the console port to the terminal server.
- Connect an Ethernet cable from the management port (the port located under the console port on the device) to the TFTP server.
- 3. On the TFTP server, assign an IP address to the connected NIC; for example, *IP address* 10.10.21 mask 255.255.255.0.
- 4. Reboot the device, and go to the boot monitor mode by pressing "b".
- 5. When in boot mode, enter the printenv command to display details of the images available on the device memory; for example:

```
ICX64XX-boot> printenv
baudrate=9600
uboot=/foundry/FGS/bootcode/kxz07400.bin
ver=07.4.00T310 (Mar 1 2012 - 11:28:23)
```

6. Provide the IP address of the TFTP server that hosts a valid software image using the **setenv serverip** command; for example:

ICX64XX-boot> setenv serverip 10.10.10.21

7. Set the IP address, gateway IP address, and netmask for the device management port, and save the configuration using the setenv ipaddr, setenv gatewayip, setenv netmask, and saveenv commands; for example:

```
ICX64XX-boot> setenv ipaddr 10.10.10.22
ICX64XX-boot> setenv gatewayip 10.10.10.1
ICX64XX-boot> setenv netmask 255.255.255.0
ICX64XX-boot> saveenv
```

#### NOTE

The IP address and the gateway IP address set for the device management port should be for the same subnet as the TFTP server NIC.

8. Enter the **printenv** command to verify the IP addresses that you configured for the device and the TFTP server; for example:

```
ICX64XX-boot> printenv
baudrate=9600
ipaddr=10.10.10.22
gatewayip=10.10.10.1
netmask=255.255.255.0
serverip=10.10.10.1
uboot=/foundry/FGS/bootcode/kxz07400.bin
ver=07.4.00T310 (Mar 1 2012 - 11:28:23)
```

9. Test the connectivity to the TFTP server from the device using the **ping** command to ensure a working connection; for example:

```
ICX64XX-boot> ping 10.10.10.21
ethPortNo = 0
Using egiga0 device
host 10.10.10.21 is alive
```

10Provide the file name of the image that you want to copy from the TFTP server using the **setenv image\_name** command; for example:

ICX64XX-boot> setenv image name images/ICX/ICX64R08000.bin

11Update the primary flash using the **update\_primary** command; for example:

```
ICX64XX-boot> update_primary
ethPortNo = 0
Using_egiga0 device
TFTP from server 10.10.10.21; our IP address is 10.10.10.22
Download Filename 'ICX64S07400.bin'.
Load address: 0x3000000
******
  ************
  ******
  *****
  ***********
  *****

```

12Load the image from the primary flash using the **boot\_primary** command; for example:

13Enter show flash and see the output to check whether the image copy process was successful.

14Copy the image from the primary to the secondary flash partition using the **copy flash flash secondary** command.

Changes between FastIron 07.4.00 or 07.5.00 and FastIron 08.0.xx.....41

## Changes between FastIron 07.4.00 or 07.5.00 and FastIron 08.0.xx

FastIron 08.0.xx adds support and enhanced functionality for a variety of desired Layer 3 features.

Modifications in specific features have changed a large amount of CLI configuration commands, **show** commands, and **show** command output. These changes are in large part due to VRF-light support in these FastIron products: FSX 800, FSX 1600, ICX 6610, ICX 6650, and FCX.

For detailed information on commands, configurations, and feature behaviors, refer to the FastIron 08.0.xx configuration guides.

For more information on supported features and platforms, refer to FastIron 08.0.xx release notes.

## New or modified parameter values

The following sections cover the changes in parameters for several protocols in FastIron 08.0.xx as compared to FastIron 07.4.00.

#### NOTE

Only the parameters with changes to allowable values or ranges are listed.

#### Management parameter default values

TABLE 8 Changes in management defaults

Parameter	Fastiron 08.0.xx	FastIron 07.4.00
Maximum number of outbound Telnet sessions	5	1
Maximum number of outbound SSH sessions	5	1

#### Multicast parameter values

TABLE 9 Changes in multicast parameter values

Parameter	Device	Fastlron 08.0.xx (minimum/ maximum/default)	FastIron 07.4.00 (minimum/maximum/ default)
Layer 2 Multicast			
IGMP Group	ICX 6430	256/4096/1024	256/1024/256

Parameter	Device	FastIron 08.0.xx (minimum/ maximum/default)	FastIron 07.4.00 (minimum/maximum/ default)
MLD Groups	FCX	256/8192/4096	256/32768/8192
	ICX 6610	256/8192/4096	256/32768/8192
	SX Gen2	256/8192/4096	256/32768/8192
	SX Gen3	256/8192/4096	256/32768/8192
	ICX 6450	256/8192/4096	256/32768/8192
	ICX 6430	256/4096/1024	256/1024/256
Layer 3 Multicast			
IGMP Groups	FCX	1/8192/4096	256/8192/4096
	ICX 6610	1/8192/4096	256/8192/4096
	SX Gen2	1/8192/4096	256/8192/4096
	SX Gen3	1/8192/4096	256/8192/4096
PIM (S,G) mcache	FCX	256/6144/1024	256/4096/1024
	ICX 6610	256/6144/1024	256/4096/1024
	SX Gen3	256/6144/1024	256/4096/1024
MSDP SA cache	FCX	1024/8192/4096	Not supported in FastIron 07.4.00
	ICX 6610	1024/8192/4096	Not supported in FastIron 07.4.00
MLD Groups	FCX	1/8192/4096	Not supported in FastIron 07.4.00
	ICX 6610	1/8192/4096	Not supported in FastIron 07.4.00
	SX Gen2	1/8192/4096	Not supported in FastIron 07.4.00
	SX Gen3	1/8192/4096	Not supported in FastIron 07.4.00
PIM6 (S.G) mcache	FCX	256/1024/512	Not supported in FastIron 07.4.00
	ICX 6610	256/1024/512	Not supported in FastIron 07.4.00
	SX Gen3	256/1800/1024	Not supported in FastIron 07.4.00

## TABLE 9 Changes in multicast parameter values (Continued)

## BGP parameter default values

Parameter	Fastiron 08.0.xx	Fastiron 07.4.00	Note
Maximum retry interval	160	N/A	If an error occurs during the establishment of BGP adjacency, the retry interval would have exponential backoff. The maximum delay can be 160 seconds.
Maximum route map length	81	32	Configures the maximum route map length when configured through SNMP (not configurable)
Default behavior for invalid confederation AS path	Ignore	Not ignored	Not configurable
Minimal route advertisement interval	0	30	Configurable
Maximum route advertisement interval	3600 sec	600 sec	Configurable
Update time	0 - 30 sec	1 - 30 sec	Configures iBGP route update interval.
Maximum ECMP paths in BGP	8/6 (stackable and Tl/ others); 32 in FastIron 08.0.30	8	Configures the number of ECMP paths
Minimum allowed update time	0	1	Not configurable
Routes displayed per page	13	5	Not configurable

#### TABLE 10 Changes in BGP, BGP4+, and Route Maps defaults

## **Command changes**

Several commands have been replaced or modified in FastIron 08.0.xx. Brocade recommends that you use the new set of commands. The following sections summarize the differences in commands between FastIron 07.4.00 and FastIron 08.0.xx.

#### 0SPFv2

TABLE 11	New OSPFv2 commands
----------	---------------------

Command	Note
Global level command (router OSPF and sub-command)	
[no] router ospf vrf	Configures OSPF instance with VRF index
[no] default-passive-interface	Sets OSPF interface passive

Command	Note
[no] max-metric	Configures Stub Router Advertisement
[no] nonstop-routing	Enables OSPF nonstop routing capability
[no] nssa-translator	Enables NSSA Type 7 to Type 5 LSA translation
[no] vrf-lite-capability	Configures CE Router VRF-Lite capability (disables DN bit checks)
cost (area decimal range sub-command)	Configures area range cost
cost (area decimal range advertise sub- command)	Configures area range cost for Advertise this type-3 summarization
cost (area decimal range not-advertise sub- command)	Configures the area range cost for Not Advertise this type-3 summarization
Interface level command	
[no] active	Configures Active information. FastIron 07.4.00 behavior was always active.
Show command	
show ip ospf database database-summary	Displays summary of OSPF database
show ip ospf summary	Displays summary of OSPF instances
show ip ospf traffic	Displays OSPF packet counters and errors
show ip ospf vrf	Displays OSPF information for interfaces configured in a particular VRF
Clear command	
clear ip ospf traffic	Clears OSPF packet counters and errors
clear ip ospf vrf	Resets OSPF for VRF

## TABLE 11 New OSPFv2 commands (Continued)

FastIron release 08.0.xx Fastiron release 07.4.00 Note

Global level command (router OSPF and sub-command)

Fastiron release 08.0.xx	Fastiron release 07.4.00	Note
[no] timers throttle spf delay hold-time max-hold	timers spf delay hold-	Fastiron release 07.4.00:
	time	<i>delay</i> corresponds to delay between receiving changes to SPF calculation. The valid range is 0 through 65535.
		<i>hold-time</i> corresponds to hold time between consecutive SPF calculations. The valid range is 0 through 65535.
		Fastiron release 08.0.xx:
		<i>delay</i> corresponds to initial delay (milliseconds) between receiving a change to SPF. The valid range is 0 through 60000.
		<i>hold-time</i> corresponds to hold time (milliseconds) between two SPF calculations. The default is 0 and the valid range is 0 through 60000.
		<i>max-hold</i> corresponds to maximum hold time (milliseconds) between two SPF calculations. The default is 0 and the valid range is 0 through 60000.
default-information- originate always	default-information- originate	In FastIron 07.4.00, the <b>default-information-</b> <b>originate</b> command was enough to originate the default route irrespective of any static or dynamic default route present on the router. However, in FastIron 08.0.xx, if no default route is present on the router, you are required to use the <b>default-</b> <b>information-originate always</b> command.
distribute-list [standard-ip- access-list   extended-ip- access-list   access-list- name   route-map route- map-name ] in	distribute-list [standard- ip-access-list   extended- ip-access-list   access- list-name] in [ethernet   ve]	In FastIron 08.0.xx, the distribute-list is applied to all interfaces. Also, you can configure the OSPF <b>distribute-list</b> command to use <b>route-map</b> <i>route-map</i> as input.
Show command		
show ip ospf area ip-addr database link-state nssa link-id adv-router router-id	show ip ospf area <i>ip-</i> addr database link-state nssa	In FastIron 08.0.xx, you can display the link state for a specific advertising router.
show ip ospf virtual link	show ip ospf virtual- links	Displays OSPF virtual link information
show ip ospf virtual neighbor	show ip ospf virtual- neighbor	Displays OSPF virtual neighbor information
Clear command		
clear ip ospf route	clear ospf route	Clears all OSPF routes or a specific OSPF route

TABLE 12	Modified OSP	Fv2 commands	(Continued)
----------	--------------	--------------	-------------

Command	Note	
Global level commands (rout	er OSPF and sub-commands)	
RFC 1583-type3-cost	In FastIron 08.0.xx, if RFC 1583 compatibility is configured, sets the cost for advertised type 3 summary LSAs to the smallest cost of any of the component networks	
Show command		
show ip ospf error	Displays OSPF warnings and errors	
show growable pool info	Displays growable pool information	
Clear command		
clear ip ospf area	Clears OSPF area	
clear ip ospf error	Clears OSPF error	
clear ip ospf graceful-restart	rt Clears OSPF graceful restart	
clear ip ospf redistribution	Clears all routes redistributed through other protocols	

#### TABLE 13 Deprecated OSPFv2 commands

## OSPFv3

#### TABLE 14 New OSPFv3 commands

Command	Note	
Global-level command (router OSPF and sub-command)		
[no] ipv6 router ospf vrf Configures OSPFv3 with a VRF index		
[no] graceful-restart helper	Configures OSPFv3 graceful restart options (helper only)	
[no] nonstop-routing	Enables the OSPFv3 nonstop routing capability	
area decimal sub-command nssa	Specifies an NSSA area	
area decimal range sub-command cost	Configures area range cost	
area decimal range advertise sub-command cost	Configures area range cost for Advertise this type-3 summarization	
area decimal range not-advertise sub- command cost	Configures area range cost for Not Advertise this type-3 summarization	
distribute-list prefix-list ascii string in loopback	Configures the OSPFv3 distribution list using an IPv6 prefix list as input	
Interface-level commands		

 TABLE 14
 New OSPFv3 commands (Continued)

Command	Note
[no] active	Sets active status. FastIron 07.4.00 behavior was always active.
[no] hello-jitter	Configures jitter between HELLO packets, in percentage
[no] suppress-linklsa	Suppresses link LSA advertisements
Show commands	
show ipv6 ospf summary	Displays summary of IPv6 OSPF instances
show ipv6 ospf vrf	Displays IPv6 OSPF information for a specific VRF interface or all VRF interfaces
Clear commands	
clear ipv6 ospf route	Clears OSPF routes
clear ipv6 ospf vrf	Clears all OSPF data, or clears data for a specific VRF interface

#### TABLE 15 Deprecated OSPFv3 commands

Command	Note	
Global level command (router OSPF and sub-command)		
[no] virtual-link-if-address	Configures the source address to use with virtual links	

## RIP

 TABLE 16
 New RIP commands

Command	Note	
Global-level command (router RIP and sub-command)		
[no] learn-default	Enables learning RIP default routes	
[no] poison-local-routes	Advertises local routes with maximum metrics when they go down	
Interface level commands		
[no] ip rip learn-default	Enables learning RIP default routes from this interface	

FastIron release 08.0.xx	Fastiron release 07.4.00		Note
Global-level command (router R	IP and sub-command)		
[no] redistribute connected   bgp   ospf   static  metric value   route-map name]	[no] redistribution		Redistributes routes from other routing protocols
[no] prefix-list name in   out	filter filter-num permit   d source-ip-address   any s mask   any [log]		Specifies the prefix list as route map to filter out specific routes
[no] timers seconds	update-time 1-1000		Configures timer to set how often RIP sends updates. This command is added for backward compatibility.
Interface-level command			
[no] ip rip metric-offset <i>num</i> in   out	ip metric <i>1-16</i>		<b>ip metric</b> is not supported. Since <b>ip</b> <b>metric</b> was used to modify RIP metric, it is changed to <b>ip rip metric-offset</b> . It is added for backward compatibility only.
[no] ip rip prefix-list <i>name</i> in   out	[no] ip rip filter-group in filter-list	out	Specifies the prefix list as route map to filter out specific routes.
TABLE 18         Deprecated RIP co	mmands		
Command		Note	
Global-level command (router R	IP and sub-command)		
[no] offset-list ACL-number-or-na [ethernet porf]	me in   out offset		d, the <b>route-map</b> or <b>prefix-list</b> command e used.
		Instea	d, the route-map command can be used.
[no] permit   deny redistribute fil static address ip-addr ip-mask [m metric value]			

#### TABLE 17 Modified RIP commands

#### **TABLE 19** Modified BGP commands

Fastiron release 08.0.xx	Fastiron release 07.4.00	Note
Clear command		
clear ip bgp flap-statistics	clear ip bgp flap-statistics as-path- filter list-num	The <b>as-path-filter</b> option is removed because flap statistics no longer have the as-path-filter option.

·	
Command	Note
Global-level command	
[no] set mirror-interface int-num	Sets a mirror interface for route maps
[no] neighbor ipvx-addr distribute-list [in   out] list- num	Configures the distribution list for BGP neighbors
[no] neighbor ipvx-addr filter-list [in   out] filter-num	Configures the filter list for BGP neighbors
[no] neighbor peer-group distribute-list [in   out] list- num	Configures the distribution list for BGP peer groups
[no] neighbor peer-group filter-list [in   out] filter- num	Configures the filter list for BGP peer groups
[no] set next-hop next-hop-addr	Configures the set route map rule for a next hop address
[no] match address-filter filter-num	Configures the match route map rule with an address filter
[no] match as-path-filters filter-num	Configures the match route map rule with an as-path filter
[no] match community-filters num	Configures the match route map rule with a community filter
[no] match next-hop next-hop-addr	Configures the match route map rule with a next hop address
[no] aggregate-address <i>ip-addr mask</i> nlri [multicast   unicast] [multicast   unicast]	Configures the MBGP Aggregate Address to advertise in BGP
[no] neighbor <i>ip-addr</i> peer-group <i>string</i> nlri [multicast   unicast] [multicast   unicast]	Configures the BGP peer group with specific NLRIs to advertise
[no] network <i>ip-addr mask</i> nlri [multicast   unicast] [multicast   unicast]	Configures the BGP neighbor to announce a network with specific NLRIs to filter
[no] match nlri [multicast   unicast]	Configures the route map match rule with multicast or unicast NLRI
[no] set nlri [multicast   unicast]	Configures the route map set rule with multicast or unicast NLRI
[no] neighbor peer-group update-source pos interface	Configures the router to communicate with a neighbor through a specified interface

**TABLE 20** Deprecated BGP and Route Map commands

#### ARP

 TABLE 21
 Modified ARP commands

Fastiron release 08.0.xx	FastIron release 07.4.00	Note
<b>[no] arp</b> ip-addr mac-addr [ <b>ethernet</b> unit/slot/port   <b>vlan</b> vlan-id ]	[no] arp num ip-addr mac-addr ethernet port	For static ARP configuration, the index number in the CLI is no longer needed.

## IGMP Snooping

Fastiron release 08.0.xx	Fastiron release 07.4.00	Note
Global level command		
[no] system-max igmp-snoop- group-addr <i>num</i>	[no] system-max igmp-max-group- addr num	Sets the maximum limit for IGMP group records

## MLD Snooping

TABLE 23 Modified MLD Snooping commands

Note         Configures MLD snooping globally. This command is now consistent with the IGMP snooping command.         x-       Sets the maximum limit for the MLD group records
command is now consistent with the IGMP snooping command. x- Sets the maximum limit for the MLD group
command is now consistent with the IGMP snooping command. x- Sets the maximum limit for the MLD group
•
Configures MLD snooping on a particular VLAN This command is now consistent with the IGMP snooping command.
Displays information related to MLD snooping. This command is now consistent with the IGMP snooping command.
Clears MLD snooping mcache or counters. This command is now consistent with the IGMP snooping command.

## IGMP (Layer 3 routing)

TABLE 24         New IGMP Layer 3 routing commands		
Command	Note	
Show command		
show ip igmp [vrf vrf-name] static	Displays IGMP static membership information. The <b>show ip igmp group</b> command also displays static IGMP membership information.	

## TABLE 25 Modified IGMP Layer 3 routing commands

FastIron release 08.0.xx	Fastiron release 07.4.00	Note
Global-level command		
[no] ip igmp group-membership- time seconds	[no] ip igmp group-membership- time seconds	Configures IGMP group membership times. The allowed range for time has
default: 260 secs	default: 260 secs	changed.
allowed range: [5 -26000] secs	allowed range: [20 - 7200] secs	
Interface-level command		
[no] ip igmp port-version version ethernet num	[no] ip igmp port-version version ethernet num	Configures the IGMP version on a physical port within a virtual routing interface. The allowed IGMP version range has changed.
allowed range: [2-3]	allowed range: [1-3]	
[no] ip igmp static-group group- addr [ethernet]	[no] ip igmp static-group group- addr [count num] [ethernet]	Configures a static member of an IGMP group. In FastIron 08.0.xx, the command does not support specifying multiple contiguous static groups using the <b>count</b> option.

#### PIM

#### TABLE 26 New PIM commands

Command	Note
ipv6 pimsm-snooping	Enables PIM6 SM snooping globally
multicast6 pimsm-snooping	Enables PIM6 SM snooping on the VLAN
Show command	
show ipv6 multicast pimsm-snooping	Displays PIM6 SM snooping information
show ip igmp [vrf vrf-name] static	Displays IGMP static membership information. The <b>show ip igmp group</b> command also displays static IGMP membership information.

#### TABLE 26 New PIM commands (Continued)

Command	Note
Clear command	
clear ipv6 multicast pimsm-snooping	Clears PIM6 SM snooping information

#### **TABLE 27** Modified PIM commands

FastIron 08.0.xx	FastIron 07.4.00	Note
Global level command		
[no] hello-timer seconds	[no] hello-timer seconds	Configures the hello timer. The default value has
default: 30 secs	default: 60 secs	been changed.
allowed range: [10 -3600] secs	allowed range: [10 -3600] secs	
[no] nbr-timeout seconds	[no] nbr-timeout seconds	Configures the PIM neighbor timeout value. The
default: 105 secs	default: 180 secs	default value and the allowed range have changed.
allowed range: [3 - 65535] secs	allowed range: [60 - 8000] secs	-
[no] prune-wait seconds	[no] prune-wait seconds	Configures the PIM prune wait timer. The allowed
default: 3 secs	default: 3 secs	range has changed.
allowed range: [0 - 30] secs	allowed range: [0 - 3] secs.	
[no] message-interval seconds	[no] message-interval seconds	Configures the message interval. The allowed range has changed.
default: 60 secs	default: 60 secs	
allowed range: [10 - 65535] secs	allowed range: [1 - 65535] secs	
[no] hardware-drop-disable Default: PMRI is enabled.	[no] hardware-drop	Configures Passive Multicast Router Insertion (PMRI). PMRI is now enabled by default.
[no] rp-address address [acl-	[no] rp-address address	Configures static RP using ACL.
um   acl-name] [std-acl-num [override]]		FastIron 07.4.00 supports only standard numbered ACL, whereas in FastIron 08.0.xx, all ACLs (standard, extended, numbered, and named) are supported.
		In FastIron 07.4.00, an RP address learned from the Bootstrap protocol takes precedence over static RP, so the <b>override</b> option was provided to give precedence to static RP. In FastIron 08.0.xx, static RP takes precedence.

Fastiron 08.0.xx	FastIron 07.4.00	Note
[no] rp-candidate ethernet	[no] rp-candidate ethernet	Configures RP candidate using ACL.
ve   loopback num	ve   loopback num [group- list std-acl-num]	In FastIron 07.4.00, ACLs can be used to limit the RP candidate for certain groups.
		In FastIron 08.0.xx, this feature is not available,

TABLE 27	Modified PIM	commands	(Continued)	)
----------	--------------	----------	-------------	---

		In FastIron 08.0.xx, this feature is not available, so the RP candidate is for all the groups.
[no] system-max pim-hw- mcache <i>num</i>	[no] system-max pim- mcache num	Sets the maximum limit for the PIM mcache (flows) that can be programmed in the hardware.
Interface level command		
[no] ip pim [version]	[no] ip pim [version]	Configures the PIM SM/DM version on a particular interface. PIM DM version 1 is no longer supported. Supported versions are PIM-SM v2, PIM-DM v1, and PIM-DM v2.

TABLE 28	Deprecated PIM commands
----------	-------------------------

Command	Note
Global level command	
[no] disable-pim	Disables the PIM operation without removing the PIM configuration.
[no] rp-address all	Removes all static RP configurations. In FastIron 08.0.xx, all static RP address configurations must be deleted individually.
Interface level command	
[no] ip pim ttl-threshold <i>ttl</i>	Configures Multicast TTL threshold on a particular interface.
	This feature was never supported in FastIron software, even though the command was available. A TTL threshold value of 1 was used internally. The behavior is the same in FastIron 08.0.00.
ip-multicast-disable	Disables multicast routing and snooping on this particular interface, or on a list of ports within a virtual interface.
Show command	
show ip pim error	Displays PIM errors counters. In FastIron 08.0.xx, a new command, <b>show ip pim counter</b> , displays the error counters.
Clear command	
clear pim flow	Clears all PIM flows from hardware.

## Network management

#### **TABLE 29** New network management commands

Command	Note
show ip dns	Shows the Domain List and IP address of the DNS server
show ip dns-server domain-list	Shows the Domain List of DNS servers
show ip dns-server server-address	Shows the IP addresses of DNS servers
show ip ssl	Displays the SSL connection in use
show management-vrf	Shows Management Virtual Routing and Forwarding (VRF) instance information
show ntp associations	Shows NTP associations
show ntp associations detail	Shows NTP associations in detail
	Shows the IPv4 address of the NTP server/peer
	Shows the IPv6 address of the NTP server/peer
show ntp status	Shows NTP status information
show snmp buffer	Shows the SNMP buffer
show cpu-utilization tasks	Shows CPU utilization tasks
show running-config vrf	Shows the VRF-Lite running configuration
show running-config vlan vlanid	Shows information on a VLAN ID in the running configuration

#### TABLE 30 Deprecated network management commands

Command	Note
show cpu-utilization detail	Shows the CPU utilization rate in detail
show rmon statistics unit	Shows the RMON Ethernet statistics table
show rmon statistics unit num	Shows the RMON Ethernet statistics table for the specified unit

# Appendix B: Show Command Output Differences between 07.4.00 and 08.0.xx Releases

There are differences in several show command outputs between FastIron 07.4.00 and 08.0.xx releases. This section provides more information about the show command output changes.

07.4.00 CLI	08.0.xx Output	Comments
show ip ospf database external- link-state advertise 2	Brocade#sh ip ospf database external-link-state advertise 1 Type-5 AS External Link States Index Age LS ID Router Netmask Metric Flag Fwd Address SyncState 1 343 0.0.0.0 192.168.98.190 0 0000000a 0000 0.0.0.0 Done LSA Header: age: 343, options: 0x02, seq-nbr: 0x80001ab8, length: 36 NetworkMask: 0.0.0.0 TOS 0: metric_type: 2, metric: 10 forwarding_address: 0.0.0.0 external_route_tag: 0	The output display includes the "Fwd Address" and "Sync State" fields.
